Customer Security Programme

Swift's Customer Security Programme (CSP) is a mandatory initiative that helps financial institutions protect their Swift footprint against cyber threats. By implementing security controls and attesting level of compliance against the Customer Security Controls Framework (CSCF), institutions demonstrate their commitment to security and contribute to the resilience and trust of the global financial ecosystem.

[Log in](#)

Stronger cybersecurity posture

Swift users implement mandatory controls from the CSCF and validate them through independent assessments—raising the bar for cyber hygiene and reducing the risk of fraud

Trust through transparency

Attestation results are visible to counterparties (when access granted) and supervisors via [KYC Security Attestation](#) (KYC-SA) and KYS, helping build trust and streamline third-party risk management

Operational efficiency

Standardised assessments and reporting templates reduce complexity, save time, and support consistent compliance across institutions

Expert guidance and support

If selected, [Swift certified assessors](#) benefit from Swift training, documentation, and direct access to CSP experts—ensuring assessments are accurate and aligned with best practices

[Log in](#)

CSP fosters collaboration through working groups and intelligence sharing via the [ISAC portal](#), helping users stay ahead of evolving threats

CSP compliance journey

1. Understand Controls

Start by reviewing the latest Customer Security Controls Framework (CSCF). Identify which mandatory and advisory controls apply to your Swift infrastructure, and familiarise yourself with the objectives, scope, and risk drivers defined in the documentation.

[Read more](#)

2. Implement Controls

Once you've identified the applicable CSCF controls, the next step is to put them into practice. This may involve, as examples, updating your Swift environments, enhancing access management, and strengthening your technical infrastructure and incident response capabilities. You can do this internally with your IT, risk, or compliance teams, or partner with a [cybersecurity service provider](#) to ensure robust implementation and alignment with industry best practices.

[Read more](#)

[Log in](#)

3. Perform Independent Assessment

Validate the effectiveness of the design and an implementation of your controls through an independent assessment. This can be performed internally by a second or third line of defence (e.g. risk, compliance, internal audit) or externally by an independent assessor.

[Read more](#)

4. Submit Attestation

Complete your attestation in the KYC-SA application, indicating your level of compliance for each applicable control. If any control is not yet met, provide a remediation date and update your attestation once compliant.

[Read more](#)

5. Leverage & Share CSP Data

Once your attestation is published in KYC-SA, it becomes visible to counterparties—supporting transparency, trust, and streamlined third-party risk management. You can also use the ISAC portal to share threat intelligence and stay informed about emerging risks, helping strengthen the resilience of the wider financial community.
